TEXON™ COTTON INSOLING MATERIAL

TEXON™ COTTON THE PREMIER CELLULOSE INSOLING MATERIAL

Texon International, the world's largest producer of structural footwear components has pioneered insoling materials for over 50 years. It offers a complete range of cellulose, non-woven and metallic based product solutions to satisfy most footwear needs.

Texon Cotton is regarded as the premier cellulose-based insoling product, providing the ultimate in quality and comfort to the wearer, whilst delivering hard wearing performance for the most demanding of footwear.

Texon Cotton is made from natural materials, utilising organic cellulose and believed to be the only insoling material made from 100% pure cotton linters, making Texon Cotton very tough and strong, yet highly absorbant, washable and comfortable.

Steve James, Director of Marketing Texon International, commented... "The insole component in a shoe provides the structural chassis of the shoe. It is subject to long-lasting stress and aggressive perspiration. Even when dried, body salts remain attacking the insole and encouraging odours. Texon Cotton insoling has been specifically designed with absorption and comfort in mind making it suitable for types of use, including in military footwear. It is lightweight, absorbent, durable and washable. It is also supplied with anti-bacterial and anti-fungal protection. We believe we are the only company that uses 100% pure cotton linters in the manufacture of insole boards."

"For over 50 years, Texon has been the industry leader in providing the world's finest insole materials and to ensure quality, consistency and customer satisfaction. We will continue to deliver high quality, performance engineered cellulose, non-woven and metallic products for the global footwear industry."
